Basic Code Analysis: Custom Express Middleware Error Pipelines

Duration : 60 Min.

Scenario

Your Express server leaks raw database stack traces to clients during exceptions. Implement a custom error-handling middleware to sanitize error payloads.

Target File Location & Creation

File to Create/Update: `student_workspace/server.js` **Input Resource File to Inspect**: `student_workspace/server.js`

Task Objectives

Perform the following actions inside the `student_workspace` directory: - Write error-handling middleware function in 'app.js' with signature (err, req, res, next) returning status 500.

Instructions to Perform the Task

1. When your workspace loads in **VS Code**, use the **Explorer** panel on the left to locate your files.
2. Open and inspect `server.js` inside `student_workspace/`.
3. Open `server.js` in `student_workspace/` and perform the required modifications.
4. Save your changes (`Ctrl + S` or `Cmd + S`).
5. Open the built-in terminal by clicking **Terminal > New Terminal** from the top menu.
6. Verify your progress by running `python run.py` locally in the terminal.

Validation

Once you have saved your files and verified your progress, return to the platform dashboard and click the **"Run Test" / "Verify"** button. This will automatically evaluate your changes and generate your score!

Grading Criteria

Test Case	Requirement	Marks
TC1	Custom middleware function declared with 4 arguments	8 Marks

TC2	Sanitizes raw SQL queries from the client error response	8 Marks
TC3	Logs raw details locally to file/console	7 Marks
TC4	Sends formatted JSON client response with public message	7 Marks

Total Score: 30 Marks

Important Notes

- This is an auto-evaluated question. Ensure all code edits are properly saved and the 'run.py' checks pass before submission.
