Basic Code Analysis: Advanced Incident RCA Audit Logging

Duration : 90 Min.

Scenario

Analyze a multi-system failure involving a network gateway timeout and a database deadlock, classify the issues, and generate a structured post-mortem log.

Target File Location & Creation

File to Create/Update: `student_workspace/solution.json` **Input Resource File to Inspect**: `student_workspace/outage_trace.log`

Task Objectives

Perform the following actions inside the `student_workspace` directory: - Fill out 'solution.json' detailing the incident correlation timeline and classification category.

Instructions to Perform the Task

1. When your workspace loads in **VS Code**, use the **Explorer** panel on the left to locate your files.
2. To initialize the environment log file, run `python setup_git.py` in the terminal inside `student_workspace/` (or inspect `outage_trace.log`).
3. Open and inspect `outage_trace.log` inside `student_workspace/`.
4. Open `solution.json` in `student_workspace/` and perform the required modifications.
5. Save your changes (`Ctrl + S` or `Cmd + S`).
6. Verify your progress by running `python run.py` locally in the terminal.

Validation

Once you have saved your files and verified your progress, return to the platform dashboard and click the **"Run Test" / "Verify"** button. This will automatically evaluate your changes and generate your score!

Grading Criteria

Test Case	Requirement	Marks
TC1	solution.json exists and is valid JSON	4 Marks
TC2	Primary classification mapped to INTEGRATION/INFRA	4 Marks

TC3	Deadlock trigger transaction correctly identified	4 Marks
TC4	Gateway timeout duration correctly calculated	4 Marks
TC5	Correlation ID matched	3 Marks
TC6	Post-mortem timeline entries are sequential	2 Marks
TC7	Mitigation steps are documented	2 Marks
TC8	Severity level correctly identified	2 Marks

Total Score: 25 Marks

Important Notes

- This is an auto-evaluated question. Ensure all code edits are properly saved and the 'run.py' checks pass before submission.
