Java Lab: Connection Pool Leak Identification

Duration : 60 Min.

Scenario

Configure HikariCP diagnostics properties inside `application.properties` to log connections that are not returned to the pool and simulate starvation.

Task Objectives

Perform the following actions inside the `student_workspace` directory: 1. Open `src/main/resources/application.properties`. 2. Configure the following database connection leak discovery options: - Enable connection leak logging detection threshold of 2 seconds (2000 ms): `spring.datasource.hikari.leak-detection-threshold=2000` - Set maximum wait time to get connection from the pool to 5 seconds (5000 ms): `spring.datasource.hikari.connection-timeout=5000` 3. Save the file.

Verification

Once you have performed the tasks, you can run the verification script to check your progress and receive your score.

Grading Criteria

Your performance will be evaluated based on the following test cases:

Test Case	Requirement	Marks
**TC1	`application.properties` file exists	10 Marks
**TC2	`spring.datasource.hikari.leak-detection-threshold` is set exactly to 2000	10 Marks
**TC3	`spring.datasource.hikari.connection-timeout` is set exactly to 5000	10 Marks

Total Score: 30 Marks
